

# Now in Jávea

## the organic to the BROWN container

The organic fraction is very important for Jávea and it depends on the entire population to manage this waste for the sustainable future of the municipality.

It all starts with a simple gesture of depositing the organic remains into the brown container.

We will reduce the quantity of waste that arrives to the landfill to be transformed into natural fertilizer.

We will reduce greenhouse gas emissions.

We will catch up of other European cities in terms of waste, complying with the SDGs of the 2030 agenda

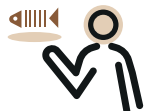

We will reduce treatment costs and generate new jobs

## What can you throw in the organic container?

(Brown Lid)

Fruit remains and vegetables

Meat remains and fish

Egg, shellfish and nut shells

Other remains of meals

Coffee grounds and infusions

Cardboard stained with food remains

Kitchen paper and dirty napkins

Small garden debris

## Beyond the container...

1

Every day we must separate organic matter when we cook or eat.

2

Until the implementation of this new collection, the non-recyclable waste container (gray) in homes contained 47% organic waste, which can now be separated into another container to allow recycling.

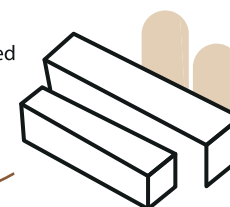

3

Collection trucks empty organic waste containers

4

Waste is transformed into fertilizer

5

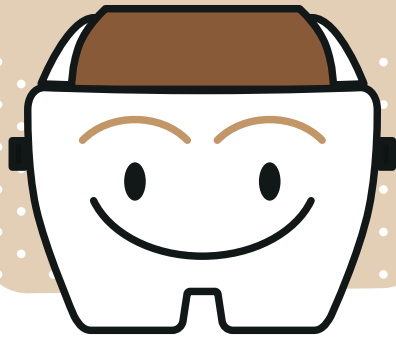

Fertilizer is also obtained that is used in fields and restoration works on slopes or environmental improvements.
